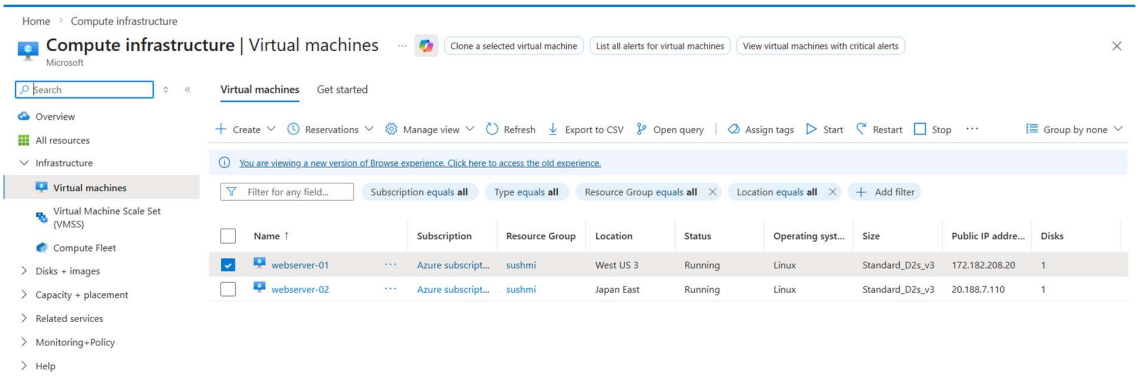
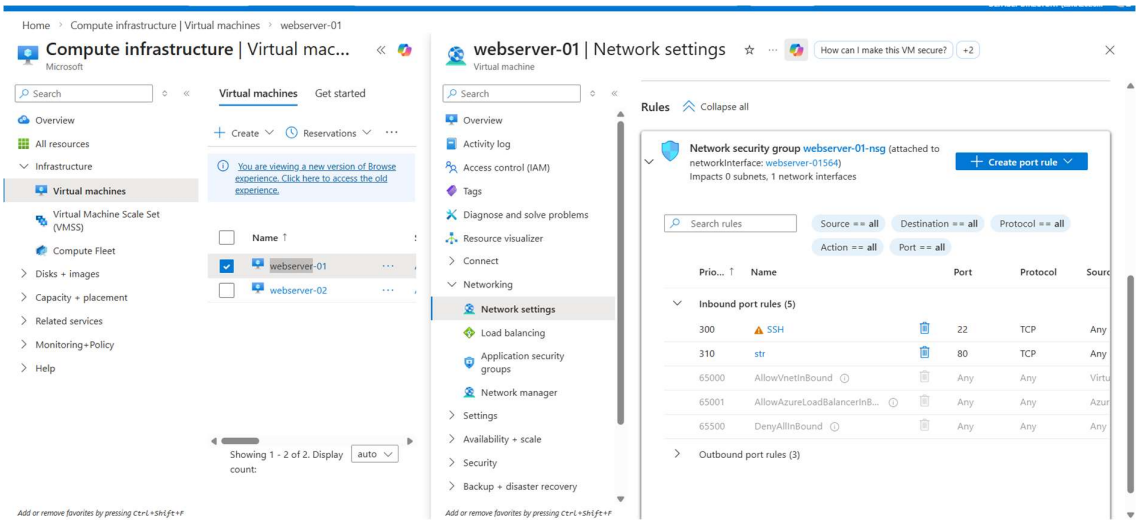
Network security group subnet level

- To create a two virtual machines



- Allow the inbound rules ssh and http in network security group



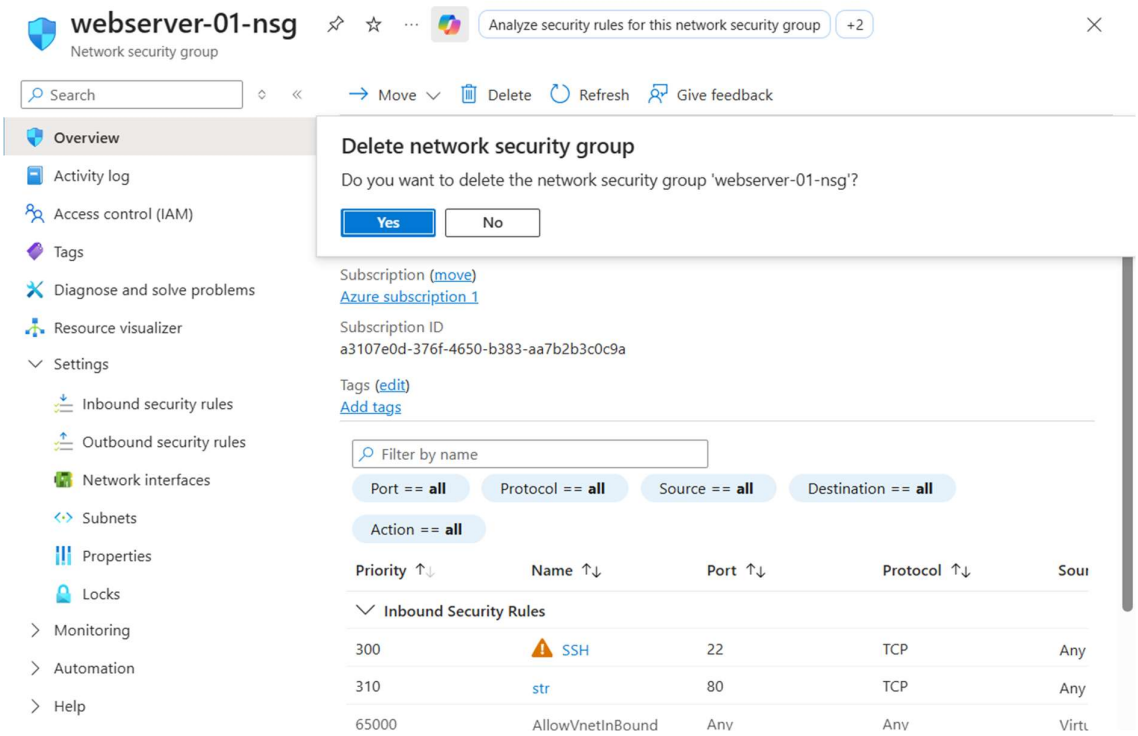
By using the public ip address browse it from internet

It will show the welcome to nginx

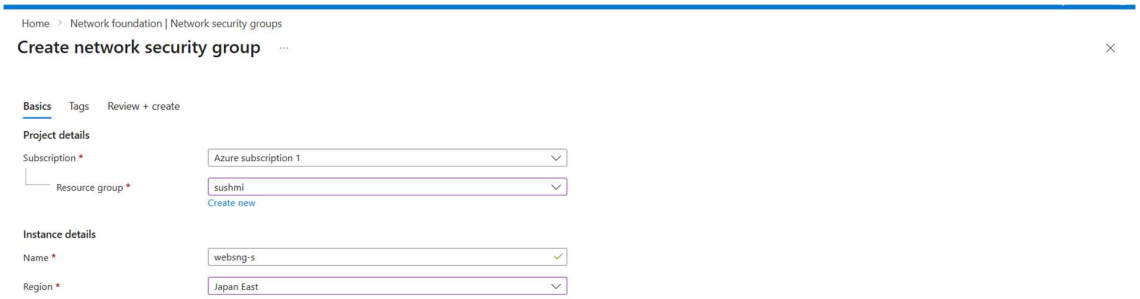
For this output. we add the inbound rules in each and every machines. we have the 50 multiple machines. we have to add rules in each machine.

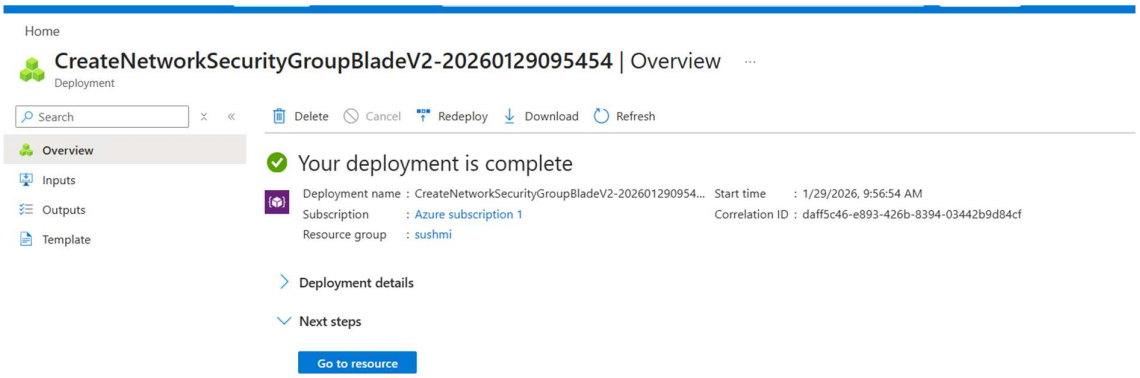
To avoid these. we use the subnet level.

For these we can detach the network security group in both machines



To create a network security group.

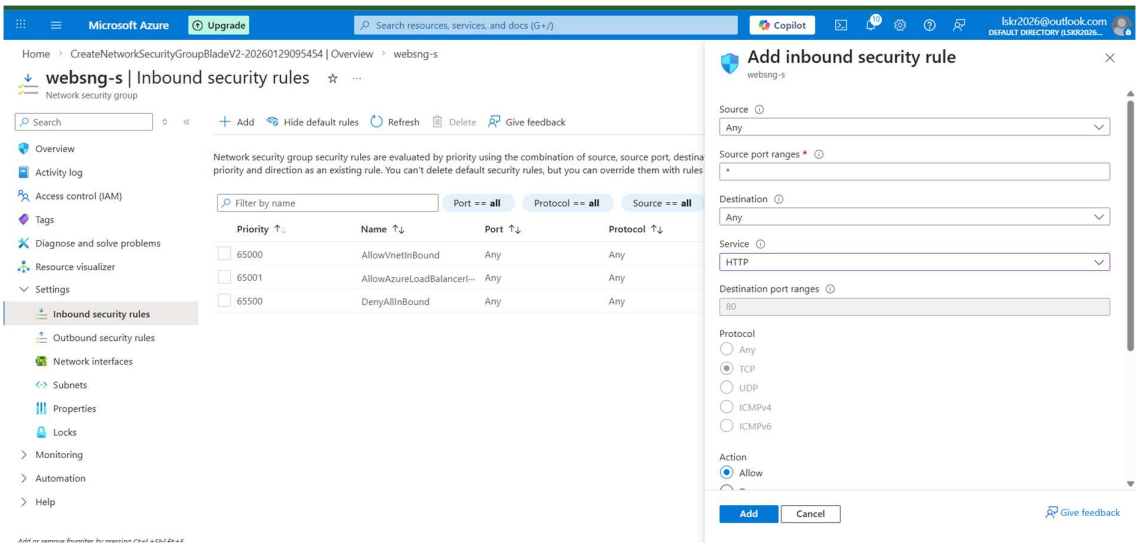




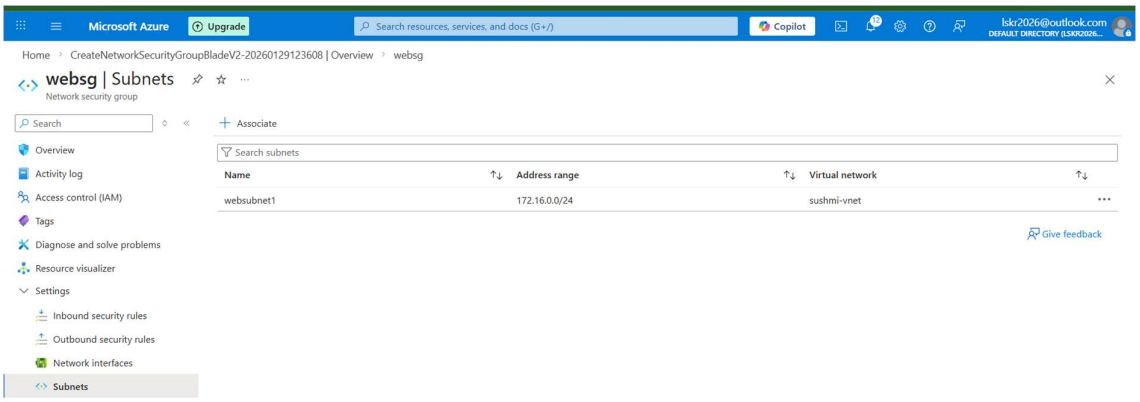
Select the created NSG

Go to the setting and select the inbound security rules

Add the inbound rules http



After we can associate the subnet to it



After that this rule will be applied to the all machines automatically.

We can browse the ip address.
