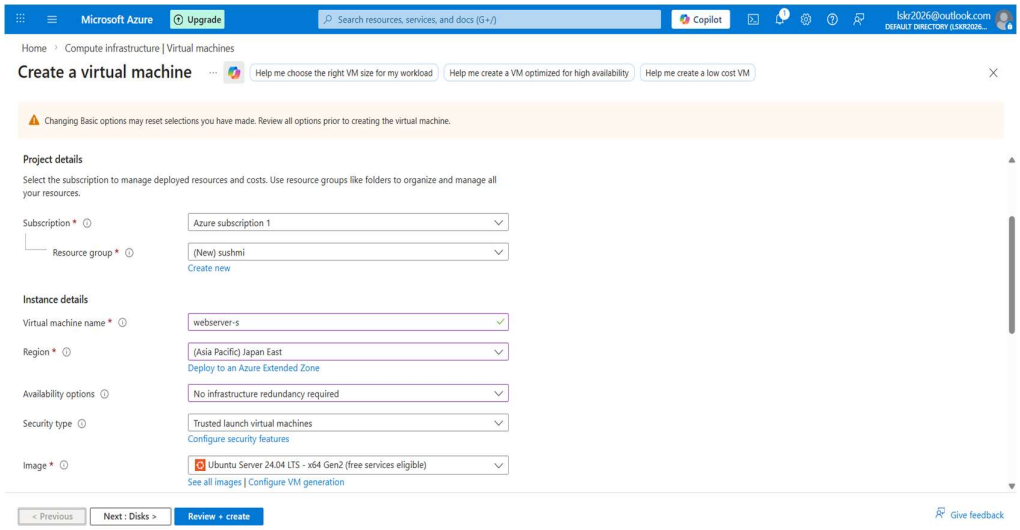
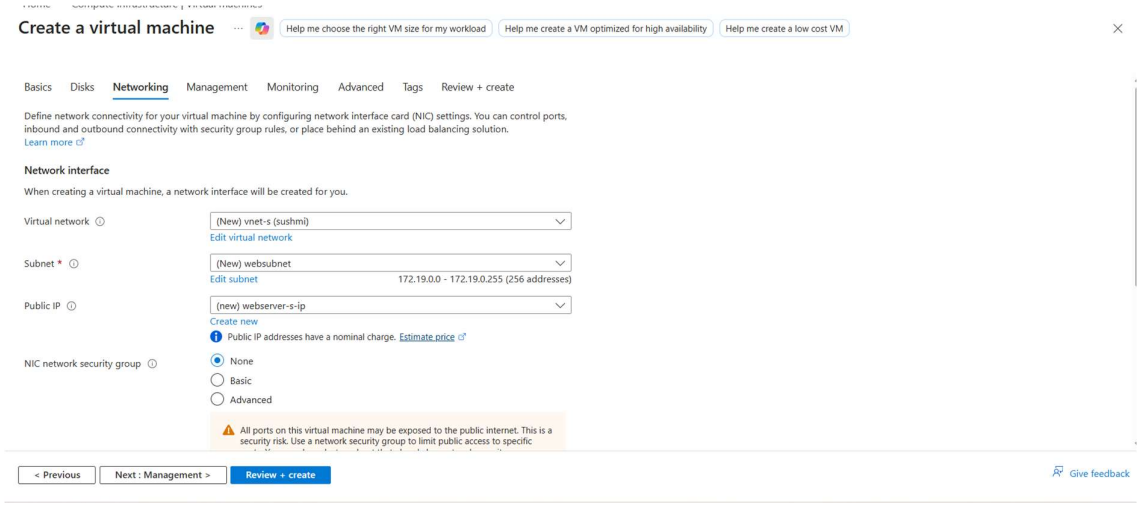
APPLICATION SECURITY GROUP

- TO CREATE A 2 VIRTUAL MACHINES
- WEB-SERVER AND APP-SERVER WITH OUT NSG

WEB-SERVER VM





Home > Compute infrastructure | Virtual machines

Create a virtual machine

Help me choose the right VM size for my workload | Help me create a VM optimized for high availability | Help me create a low cost VM

Select a VM application to install

Custom data and cloud init

Pass a cloud-init script, configuration file, or other data into the virtual machine **while it is being provisioned**. The data will be saved on the VM in a known location. Learn more about custom data for VMs

Custom data

```
#!/bin/bash
sudo su
apt update
apt install nginx -y
```

Custom data on the selected image will be processed by cloud-init.
Learn more about custom data for VMs

User data

Pass a script, configuration file, or other data that will be accessible to your applications throughout the lifetime of the virtual machine. Don't use user data for storing your secrets or passwords. Learn more about user data for VMs

Enable user data ☑

Performance (NVMe)

Enable capabilities to enhance the performance of your resources.

APP SERVER VM

Home > Compute infrastructure | Virtual machines

Create a virtual machine

Help me choose the right VM size for my workload | Help me create a VM optimized for high availability | Help me create a low cost VM

Basics | Disks | Networking | Management | Monitoring | Advanced | Tags | Review + create

Define network connectivity for your virtual machine by configuring network interface card (NIC) settings. You can control ports, inbound and outbound connectivity with security group rules, or place behind an existing load balancing solution.
Learn more

Network interface

When creating a virtual machine, a network interface will be created for you.

Virtual network: vnet-s (sushmi)
Edit virtual network

Subnet *: (New) app-subnet
Edit subnet — 172.19.1.0 - 172.19.1.255 (256 addresses)

Public IP: (new) app-sever-s-ip
Create new
Public IP addresses have a nominal charge. Estimate price

NIC network security group:
- None
- Basic
- Advanced

All ports on this virtual machine may be exposed to the public internet. This is a security risk. Use a network security group to limit public access to specific ports. You can also select a subnet that already has network security groups defined or remove the public IP address.

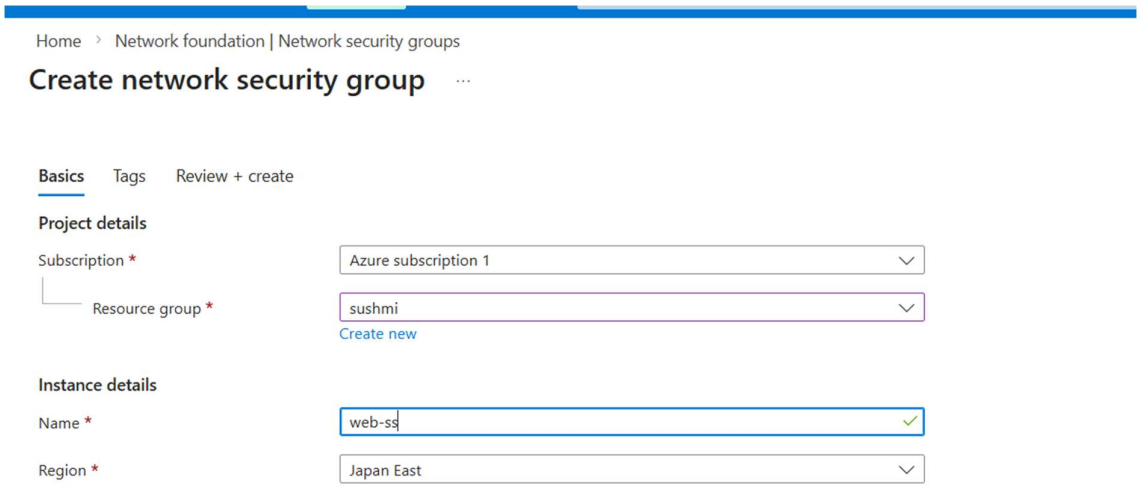
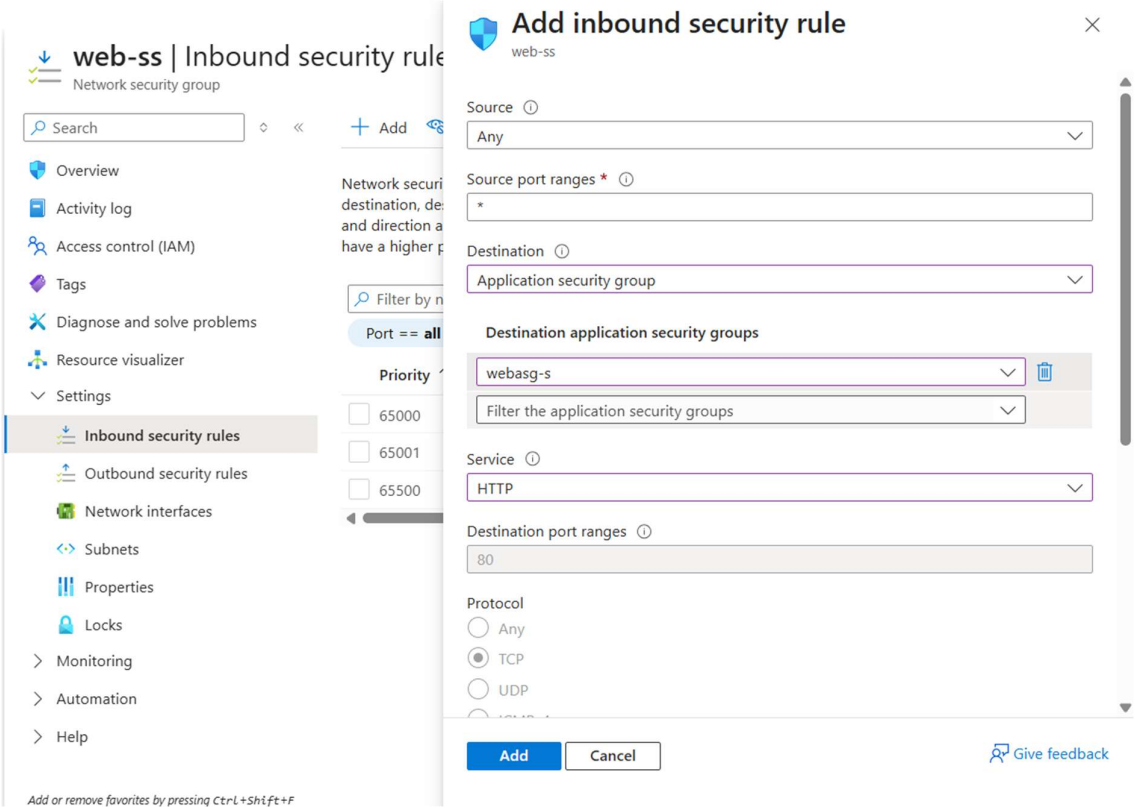
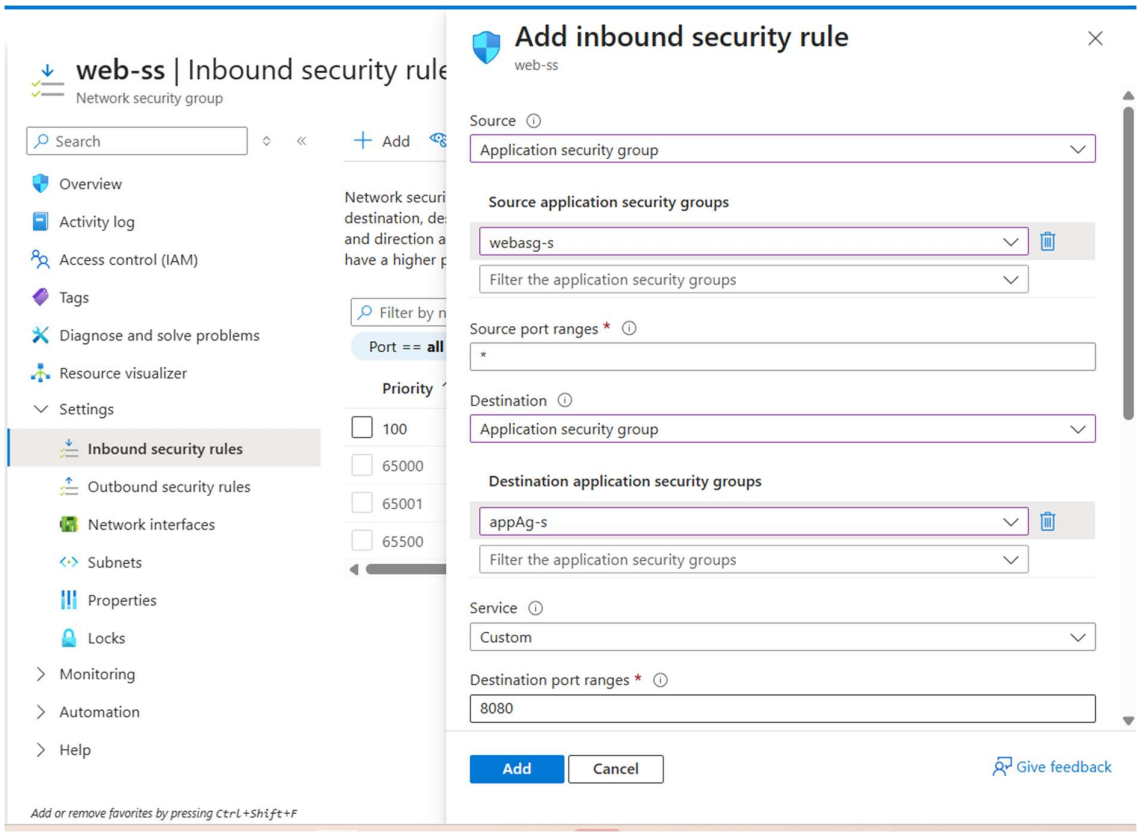
Network security group security rules are evaluated by priority using the combination of source, source port, destination, destination port, and protocol to allow or deny the traffic. A security rule can't have the same priority and direction as an existing rule. You can't delete default security rules, but you can override them with rules that have a higher priority. Learn more
Filter by name
Port == all
Protocol == all
Source == all
Destination == all
Action == all
Priority
Name
Port
Protocol
Sour
100 http 80 TCP Any
110 sdf 8080 Any
120 ssh 22 TCP Any
65000 AllowVnetInBound Any Any Virtu
65001 AllowAzureLoadBalan··· Any Any Azur
65500 DenyAllInBound Any Any Any

NOW WE CAN CREATE A NETWORK SECURITY GROUP

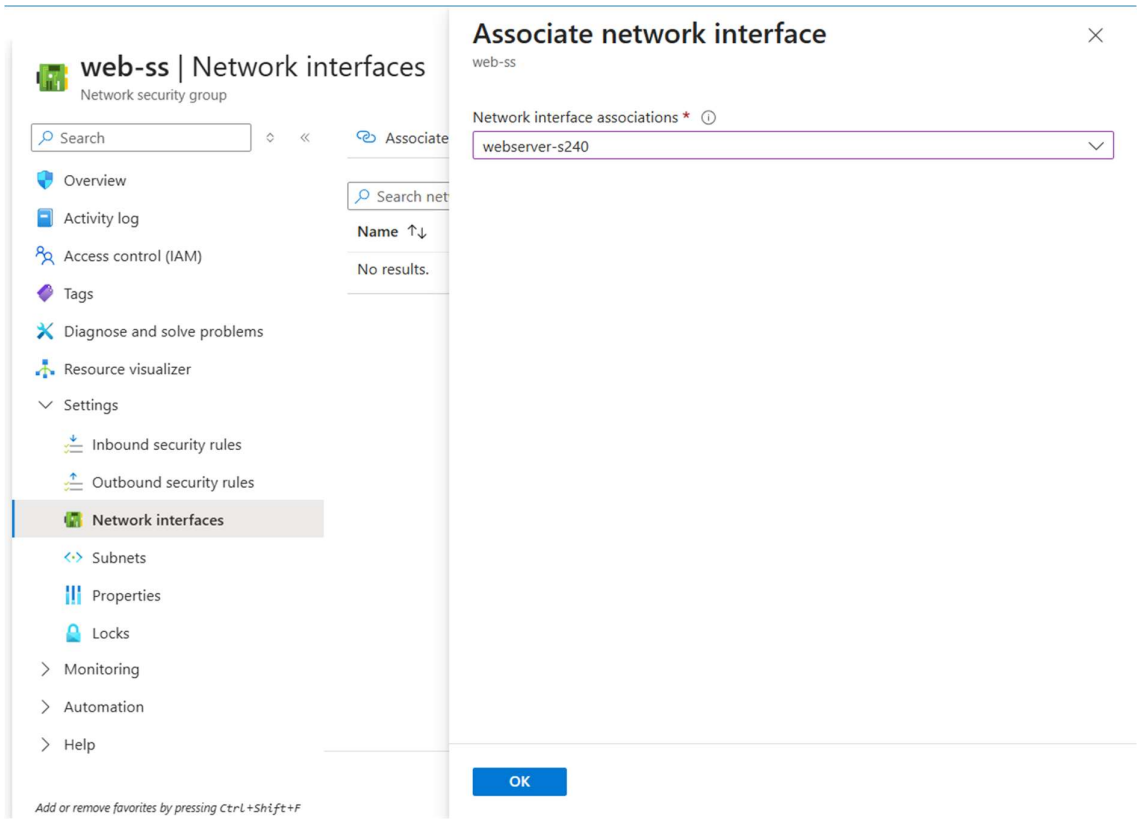


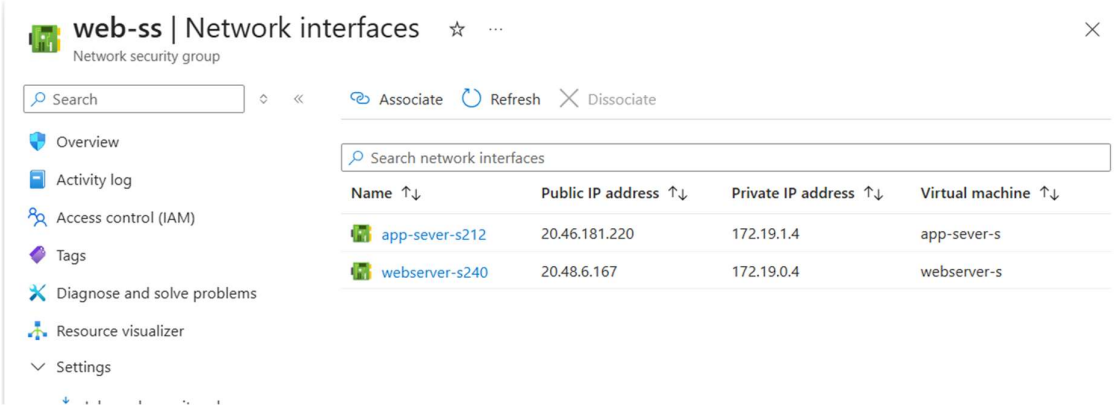
ADD THE INBOUND RULES





ASSOCIATE THE NETWORK INTERFACE





NOW WE CAN SEE THE RULES IN BOTH WEB-SERVER AND APP-SERVER
